**U. S. ARMY RESEARCH INSTITUTE (ARI)  
FOR THE BEHAVIORAL AND SOCIAL SCIENCES**

**FY1992/FY1993  
TECHNOLOGY BASE  
PROGRAM**

**INTRODUCTION**

*Everything we do to build the trained and ready Army of the future must have, as its primary focus, the men and women of the total Army.*

General Carl E. Vuono, CSA  
*A Strategic Force for the 1990s  
and Beyond, January 1990*

**OVERVIEW**

This document describes ARI's basic research (6.1), exploratory development (6.2) and advanced development (6.3A) efforts in support of the Army's Soldier-Oriented Research and Development in Personnel Performance and Training (SORD-PT) program. This program is executed by ARI under the supervision of the DA Deputy Chief of Staff for Personnel (DCSPER), who receives broad guidance from the Assistant Secretary of the Army for Research, Development and Acquisition (ASA(RDA)) and the Assistant Secretary of the Army for Manpower and Reserve Affairs (ASA(M&RA)).

This document describes ARI's FY1992 and FY1993 6.2 and 6.3A programs in detail. The basic research program is described briefly; it is documented more fully elsewhere. The full ARI program includes a research-based study and analysis program (6.5-funded) which is also documented elsewhere.

**U. S. ARMY RESEARCH INSTITUTE FOR THE BEHAVIORAL AND SOCIAL SCIENCES**

ARI, a field operating agency of the DA DCSPER, is the developing agency for a major portion of the DCSPER's SORD-PT program. As specified in AR 70-6 and AR 70-8, the DCSPER directs and monitors the planning, programming, budgeting and execution activities of ARI in the conduct of its comprehensive R&D program. The Commander of ARI, under the staff supervision of the Assistant DCSPER (ADCSPER), exercises management oversight responsibility for planning and execution of the ARI R&D program. As a developing agency, ARI's program is governed by DCSPER guidance and the provisions of AR 70-1, AR 70-6 and AR 70-8.

# ARI TECHNOLOGY BASE INVESTMENT STRATEGY

## ARMY IMPERATIVES:

The soldier is the basic element of land warfare. How does the Army recruit and retain quality people who can be trained to Army standards and are properly equipped to accomplish their mission. The Army's success in peace or war is, in large part, a function of its ability to address these factors.

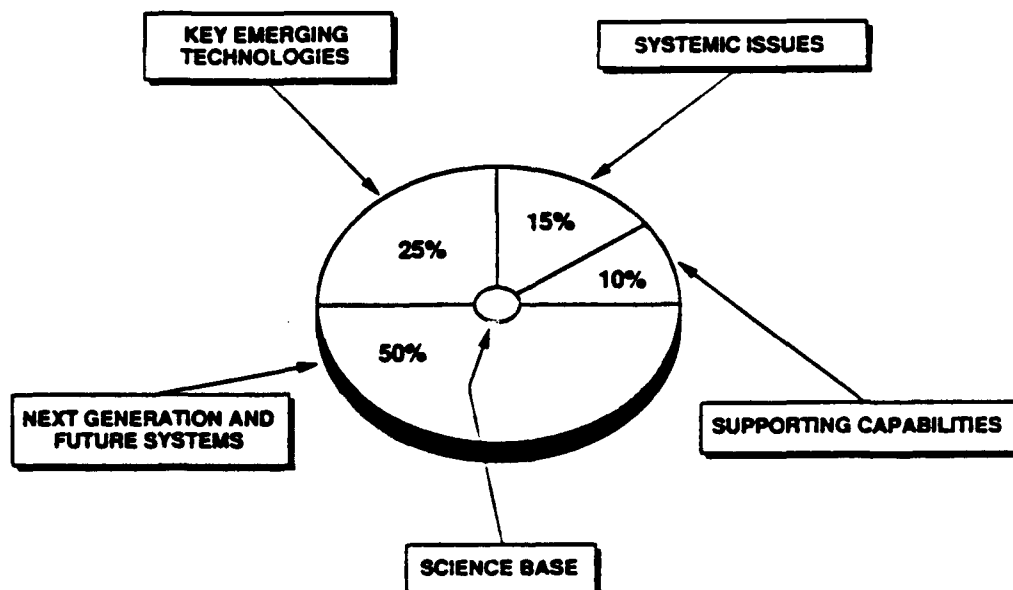

The Army's SORD-PT program directly addresses research and development concerns related to four of the Army's six fundamental imperatives: quality soldiers and civilians; tough, realistic training; materiel modernization; and leader development. (Starting in FY92, through its research-based study and analysis program, it will directly support other Army organizations in the remaining imperatives, warfighting doctrine and optimal force structure.)

## ARMY TECHNOLOGY BASE MASTER PLAN (ATBMP) GUIDANCE

The Army's Technology Base Investment Strategy (TBIS) partitions the technology base program into four descriptive domains, as shown in Figure 1. The percentages shown in the figure "depict a reasonable goal for distributing funds in each of the four descriptive domains based upon the best judgment of the Army technology base leadership." (page I-18, ATBMP, Nov 1990).

Figure 1

## TECHNOLOGY BASE RESOURCE DISTRIBUTION

As part of its investment strategy, the Army is focusing on priority efforts by establishing a set of science and technology objectives (STO) - "a specific, measurable, major technology advancement to be achieved by a specific fiscal year consistent with the funding available..." The nine ARI STOs are given in Appendix A. In FY91, 30 of 71 R&D tasks, or 42% of the program, were directly supporting STOs. Funding for these tasks amounted to approximately \$18 million, 55% of FY91 6.2 and 6.3A funding. For FY92, approximately the same percent of the program will be covered by STOs.

#### ARI FY92 PROGRAM

The ARI exploratory development and advanced development programs are an integral part of the domain of **Systemic Issues** (which collectively with the Army's other Systemic Issues account for 15% of the Army's technology base funds). ARI's FY92 exploratory development (6.2) and advanced development (6.3) funding is shown in Figure 2.<sup>1</sup> The exploratory development program includes an Innovative Ideas from Industry (I<sup>3</sup>) Program to be initiated in FY92.

**FIGURE 2**  
**FY92 PROGRAM**

Excludes ARI Admin & Mgmt Acct

<sup>1</sup> 24 May 1991 funding figures.

## **PROGRAM DEVELOPMENT**

### **GENERAL**

ARI's Soldier-Oriented R&D in Personnel Performance and Training (SORD-PT) addresses the full range of systemic soldier issues related to manpower, personnel and training in an Army-wide Research, Development, Test and Evaluation (RDT&E) program. This R&D program is carried out with fiscal resources from four funding categories: Research (6.1), exploratory development (6.2), advanced development (6.3A), and study and analysis (6.5).

The total program is developed to exploit technology ("Technology Push") for improved soldier performance, as well as to reflect the needs of soldiers and leaders in the field ("Requirements Pull"). (See Figure 3.)

"Technology Push" and "Requirements Pull" are integrated with guidance from the Deputy Chief of Staff for Personnel (DCSPER) into a draft program covering the Budget Fiscal Year (BFY) through the Program Objective Memorandum (POM). The ARI Commander and Technical Director then present the program to the SORD-PT General Officer Steering Committee (GOSC) which provides advice to the DCSPER who approves the BFY - POM technology base program (6.2 and 6.3A) and the BFY/TFY study and analysis program (6.5).

The DCSPER is the proponent for all research and exploratory development efforts. Every advanced development effort requires a proponent/sponsor before the 6.3A task is initiated. In addition, for each 6.3A task there is a Memorandum of Agreement (MOA) that spells out the R&D responsibilities of ARI and the implementation responsibilities of the proponent/sponsor.

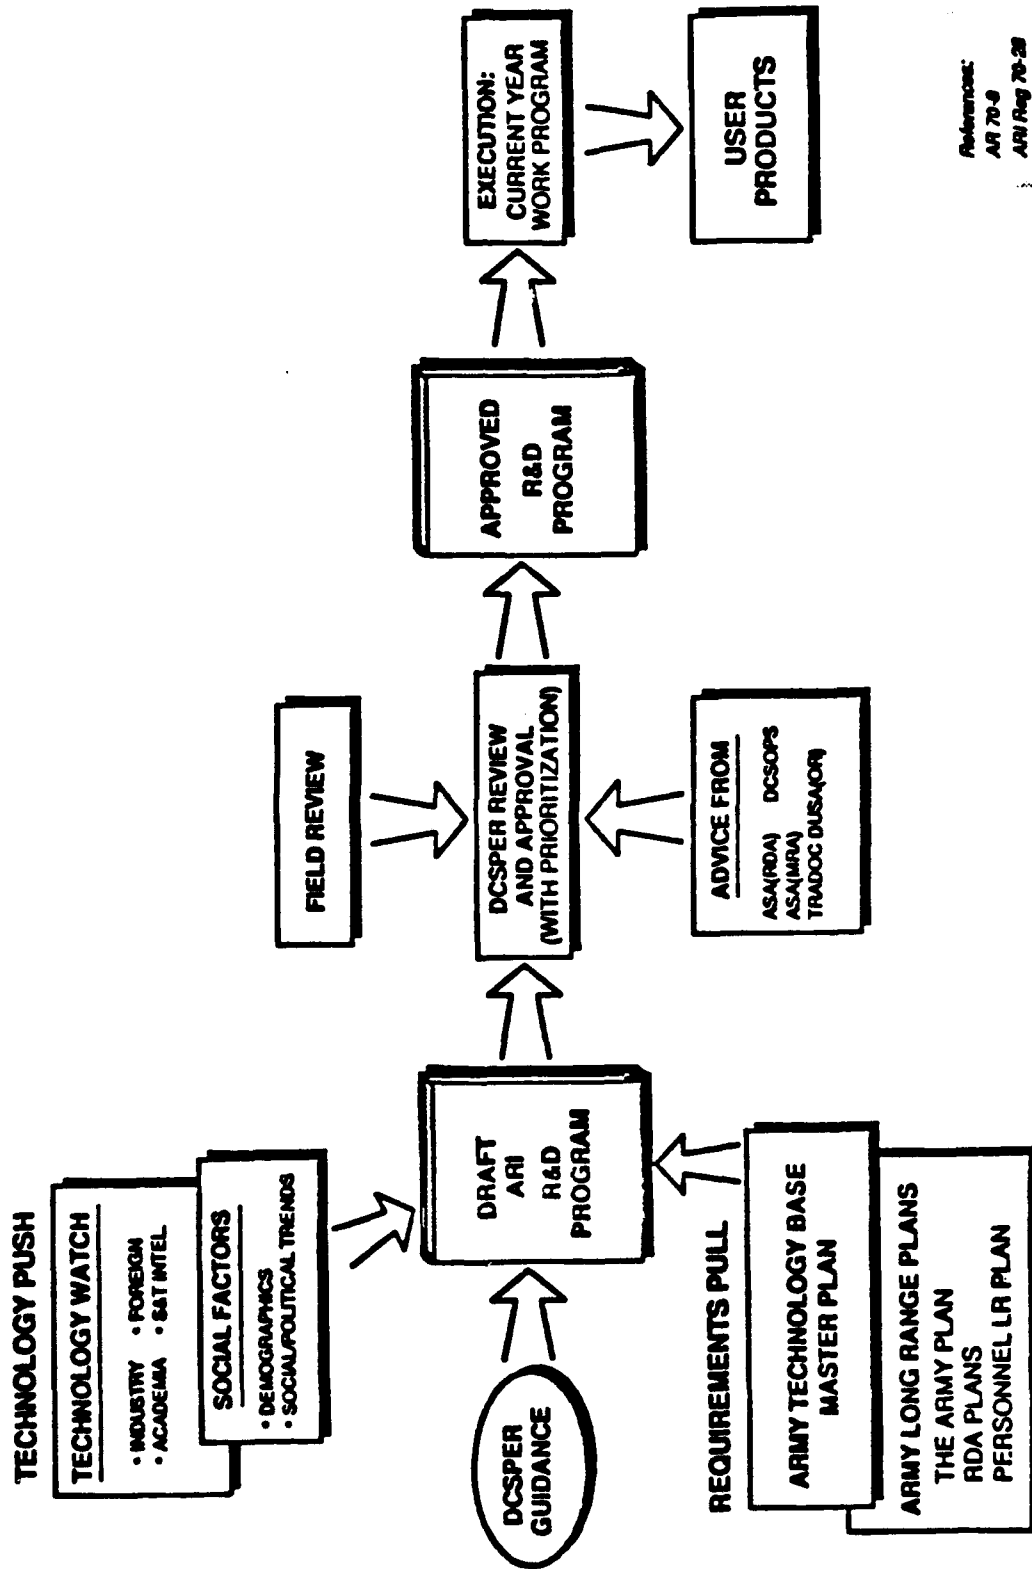

For the research and exploratory development programs, priorities are established by the ARI Commander and Technical Director and approved by the DCSPER, with advice from the SORD-PT GOSC.

The advanced development program is reviewed in the field by sponsors and major commands. Each reviewing command is asked to rank-order the advanced development tasks comprising the program. The various responses are consolidated at ARI and presented to the DCSPER for approval.

### **SPECIFIC**

Each laboratory through its technical areas and field units and the ARI Office of Basic Research are responsible for maintaining up-to-date descriptive information and resource data

# FIGURE 3 ARI PROGRAM DEVELOPMENT

References:  
AR 70-9  
ARI Reg 70-28

APR 91

for each R&D task (work package) and work unit for which it is responsible. The Office of Basic Research also prepares a document covering its basic research and Independent Laboratory In-House Research (ILIR) programs. Using the descriptive information and resource data available for each task, the Plans, Programs and Operations (PP&O) Office prepares documents for program review and prioritization (See Figure 4).

The Science and Technology Plan covers the ARI advanced development program from the Budget Fiscal Year (BFY) through the POM-years. To ensure that ARI addresses the Army's most critical soldier problems, field priorities for the 6.3A tasks are obtained from major proponents and ARSTAF agencies: ODCSPER, TRADOC, ASA(M&RA), DCSOPS, and ASA(RDA).

These offices also provide members to the SORD-PT General Officer Steering Committee (GOSC). This committee meets to review and recommend to the DCSPER a final, consolidated rank-ordering of the tasks comprising the advanced development program. The GOSC reviews the exploratory development priorities established internally for the BFY, reflecting ARI management judgement of the relative importance of the technologies that must be developed to support future 6.3A efforts. The GOSC also reviews the planned BFY research-based studies and analysis program.

Following GOSC review, the DCSPER approves the exploratory development, advanced development, and research-based studies and analysis programs for the BFY.

The laboratories amend R&D program plans to conform to DCSPER guidance. The laboratories and the Basic Research Office ensure that the information they have entered into the ARI-MIS reflects priorities established and changes requested by the DCSPER. The ARI 6.2 and 6.3A programs are then documented in the BFY/TFY Research and Development document. (The 6.1 and research-based study and analysis programs are documented separately.)

The Commander and the Technical Director review and approve the draft document. After required changes are made, the final document is submitted to the DCSPER for approval.

During the fourth quarter of the CFY, PP&O provides the Financial Management Office (FMO) the fiscal data necessary to prepare Funding Authorization Documents (FAD) and Fund Citations.

## PROGRAM EXECUTION

The DCSPER is the sponsor of ARI's basic research and exploratory development efforts. The research program extends the frontiers of scientific knowledge in the behavioral and social sciences. The exploratory development program is directed

# FIGURE 4

toward the exploitation of technological opportunities for the solution of systemic soldier-related problems and issues.

Successful exploratory development efforts are transitioned to 6.3A funding. Advanced development efforts are sponsored by Army staff agencies and major commands, primarily the ODCSPER and the Training and Doctrine Command (TRADOC). (A sponsor who is in a position to ensure the effective implementation at an Army-wide level is called a proponent.) A sponsoring organization is responsible for:

- \* assisting in the strategic planning of a new SORD-PT effort.
- \* supporting the execution of the R&D, at times fiscal resources and/or troops to serve as research subjects.
- \* staying abreast of R&D progress.
- \* implementing successful products of the SORD-PT program.

For all advanced development tasks, a Memorandum of Agreement (MOA) is negotiated between the proponent/sponsor and ARI and serves as a requirement document for the effort. The MOA is an agreement on the part of ARI to commit R&D resources for the execution of the effort and an agreement on the part of the proponent/sponsor to implement the results of a successful R&D effort.

## BASIC RESEARCH (6.1) PROGRAM

The following page provides a synopsis of the ARI basic research program.

---

## ARI BASIC RESEARCH (6.1) PROGRAM

---

### PROGRAM OBJECTIVE:

To add new knowledge and generalizable principles in the behavioral sciences and its many subdisciplines, providing the basis for innovative technological solutions to unresolved people-related problems.

### APPROACH:

A portion of this program is conducted in-house. However, most the program is conducted under contract by behavioral scientists in universities. A portion of available funding is earmarked for meritorious proposals from historically black colleges and from other minority institutions.

Innovative research ideas are solicited from academia through a broad agency announcement (BAA). Research programs range from one to five years; but, with current funding limitations long term efforts are rare. Single-investigator and collaborative research efforts are acceptable, as are multidisciplinary approaches to a central problem. Collaborative efforts may involve researchers at a single institution or in cooperating institutions.

### TECHNOLOGY OBJECTIVES:

The ARI FY92/93 basic research program (described in more detail in FY1992/1993 Basic Research Program) will support a full-range of in-house and contract efforts, focusing on the following:

**Group Performance Processes and Measurement:** Research topics in this area include: group problem solving and decision making, theoretical approaches to human resource modeling and performance prediction, and leadership and motivation of performance.

**Learning and Cognitive Foundations for Advanced Training Technology:** Research topics in this area include: analysis of rapid problem solving, and individual difference factors in learning and retention of high-demand tasks.

## **SECTION I**

### **Exploratory Development (6.2) Program**

### **Innovative Ideas from Industry (I<sup>3</sup>) Program**

**PROGRAM AREA 1: Structuring and Equipping the Force**

**PROGRAM AREA 2: Manning and Leading the Force**

**PROGRAM AREA 3: Training for Combat Effectiveness**

---

## INNOVATIVE IDEAS FROM INDUSTRY (I<sup>3</sup>) PROGRAM

---

### PROGRAM OBJECTIVE:

To stimulate faster development of innovative ideas for making significant improvements in personnel and training performance.

### APPROACH:

Innovative research and development ideas will be solicited from the private sector for the development and application of new technologies in the behavioral and social sciences (and related disciplines) and to accelerate their transition to utilization.

This exploratory development (6.2) program will be initiated in FY92. Ideas will be solicited from industry through a broad agency announcement (BAA). Preference will be given to short-term (1-2 year) efforts demonstrating high-risk/high-gain technology or novel and "leading edge" applications.

### TECHNOLOGY OBJECTIVES:

The I<sup>3</sup> program considers all areas of manpower, personnel and training with an FY92/FY93 focus in the following five areas:

**Technologies for Rapid Surveys:** Technology that will exploit recent advances in automation and software, as well as sampling theory, item construction, communication and statistics.

**Team Perfect Performance:** Technology for achieving and measuring error-free performance in teams and crews.

**Training for Mission Rehearsal:** Engagement simulation training methods that will provide the basis for ensuring the cost-effective utilization of major recent advances in computer and graphics technology (e.g., networking and "virtual reality").

**Technology for Analyzing Unit Tactical Performance:** Application of advanced analytic techniques, such as chaos and catastrophe theories and the concept of neural networks, to maximize the utility of the data from instrumented training conducted at the National Training Center.

**Models for the Redesign of Organizations:** Technology for the application of advances in organizational and management theory to the design and "downsizing" of Army organizations.

### POINT OF CONTACT:

ARI Office of Basic Research, PERI-BR

## **Exploratory Development**

### **PROGRAM AREA 1: Structuring and Equipping the Force**

- 1102: CONTROLLING EXCESSIVE WORKLOAD IN ARMY FORCE DEVELOPMENT AND SYSTEM ACQUISITION PROCESSES**
- 1211: IMPROVING CREW AND TEAM LEVEL PERFORMANCE IN AVIATION AND GROUND OPERATIONS**
- 1212: SOLDIER DECISION PROCESS ERRORS IN FIRE SUPPORT INTEGRATION**
- 1213: CONCEPTS FOR EXTENDING THE PERFORMANCE OF MILITARY SYSTEMS IN COMBAT**
- 1215: AIR DEFENSE ARTILLERY C3I AND TARGET IDENTIFICATION**
- 1301: IMPROVED METHODS FOR BATTLE COMMAND TRAINING**
- 1303: ENHANCED TECHNIQUES FOR COMMAND STAFF PERFORMANCE**
- 1306: INTELLIGENCE AND ELECTRONIC WARFARE SOLDIER PERFORMANCE FOR BATTLEFIELDS OF THE FUTURE**
- 1308: METHODS FOR EVALUATING C2 PROCESSES AND PERFORMANCE**

---

**1102: CONTROLLING EXCESSIVE WORKLOAD IN ARMY FORCE DEVELOPMENT  
AND SYSTEM ACQUISITION PROCESSES**

---

**TECHNOLOGICAL OPPORTUNITY:**

The absence of validated techniques for predicting individual operator and crew workload in Army systems has limited the Army's capability to conduct meaningful front end analyses early in the design of new and improved systems. Historically, operator and crew workload issues have significantly impacted the cost and operational effectiveness of such systems. However, such issues have generally been identified only after system development and fielding.

**TECHNOLOGICAL OBJECTIVE:**

To develop reliable and valid methods which (1) forecast, for a given design, the impact of operator mental workload on the performance of new Army systems, (2) allocate workload-imposing tasks among soldier, hardware, and software components of systems and assess the influence of workload factors on the organizational design of Army units, and (3) establish procedures for the selection, classification, and training of soldiers to effectively cope with operator workload in operational situations.

**TECHNOLOGICAL IMPACT:**

The Army's continued modernization with declining resources can ill afford developmental risk. Yet, in more complex weapon systems, crew workload tolerance becomes an increasingly critical risk in system design and operational effectiveness. Validated workload prediction tools will allow the Army's combat and materiel developers to identify and resolve critical soldier-system incompatibilities early in the weapons system design process, thus avoiding costly design changes. These methods will also identify strategies for tough training to increase soldier workload tolerance under varying battlefield conditions.

**6.2 PRIORITY: 6 OF 25**

| <b>FUNDING:</b> | <b>FY92</b> | <b>FY93</b> | <b>END DATE: FY92</b> |

SYSTEMS RESEARCH LABORATORY

**PROGRESS:**

|   |      |
|---|------|
| Published the results of a comprehensive review and evaluation of Operational Workload (OWL) assessment methods                                       | FY89 |
| Completed Version 2.0 of the systematic organizational design (SORD) software and a draft user's manual   | FY90 |
| Completed an in-house workload analysis of the Stingray system during a concept evaluation field test   | FY90 |
| Published a primer on the SORD methodology  | FY90 |
| Conducted a field test of SORD Version 2.0 at eight TRADOC schools and centers, and completed SORD Version 2.5  | FY91 |
| Published the Crew Requirements Definition System (CRDS) software and user's manual as an ARI Research Product  | FY91 |
| Published the SORD Version 2.5 software and user's manual   | FY91 |
| Published the Operator Workload Knowledge-Based Expert System Tool OWLKNEST software and user's Handbook for Operating the OWLKNEST Technology (HOOT) | FY91 |
| Published an ARI Technical Report based on the workload analysis of the Stingray system   | FY91 |

**FY92/FY93 MILESTONES:**

|  |      |
|--|------|
| Evaluation of current and potential force design techniques and procedures | FY92 |
| Complete the development of SORD Versions 3.0                              | FY92 |

**PROJECTED TECHNOLOGY PRODUCTS:**

|   |      |
|---|------|
| SORD version 3.5 software and user's manual   | FY92 |
| Comparative evaluation of alternative techniques for predicting operator workload and performance | FY92 |

---

**1211: IMPROVING CREW AND TEAM LEVEL PERFORMANCE IN AVIATION  
AND GROUND OPERATIONS**

---

**TECHNOLOGICAL OPPORTUNITY:**

The objective of this exploratory development project is to (1) identify and isolate specific human error factors which significantly degrade crew-team coordination and performance; (2) provide proof-of-concept demonstrations of selection, training, and evaluation technologies which are effective in improving performance at the crew-team level; and (3) refine the basic methods and taxonomies for investigating, documenting, and predicting crew and team level performance in aviation and ground combat systems to improve soldier-materiel system design.

**TECHNOLOGICAL OBJECTIVE:**

Project objectives are (1) to identify human error factors prevalent in Army aviation and ground operation accidents, and to identify promising near-term strategies for reducing these accident causes through training, leadership, selection and classification, and materiel countermeasures; (2) to develop and validate improved procedures for investigating and documenting human error factors in Army aviation and ground weapon system operations (FY89-90); and (3) to demonstrate and evaluate prototype materiel and other countermeasures for improving the safety of Army aviation and ground weapon system operations.

**TECHNOLOGICAL IMPACT:**

70 to 80% of Army Class A aviation accidents are described by the Army Safety Center as being due to "pilot error." To reduce the rate of these accidents requires that the root causes of "pilot error" be identified beyond assuming "willful negligence." A further behavioral explanation of these error sources would enable pilot leadership, policy, or organization changes to reduce fractionally the \$250M/year loss in property and soldier resources.

**1212: SOLDIER DECISION PROCESS ERRORS IN FIRE SUPPORT  
INTEGRATION**

---

**TECHNOLOGICAL OPPORTUNITY:**

The introduction of automated decision support systems for use by command and control (C2) staffs and field artillery system crews is having numerous effects upon the Army. Examples include decentralization of decision making, potential reduction in the size of crews and staffs, and revisions in organizational structures. The result is a reduction in battlefield effectiveness until means are worked out for making optimal use of the new support systems. Field artillery, whose proper utilization and effectiveness is dependent upon an efficiently functioning C2 process, is particularly affected. Fire support is most effective when it is fully integrated into the operational plan and properly managed through efficient C2 processes during execution of the plan.

**TECHNOLOGICAL OBJECTIVE:**

To develop methods to identify and investigate those soldier and computer interface attributes that contribute to soldier error in computer-aided decision making. Particularly relevant to field artillery, this research will use a computer-based battle simulation facility to identify soldier errors in fire support planning at battalion and brigade levels.

**TECHNOLOGICAL IMPACT:**

This research will lead to a better understanding of how decision making errors in fire support planning and integration during the C2 process contribute to decreases in fire support effectiveness. This will lead to improved integration of fire support into battlefield operations. Extended to other battlefield systems, the results will lead to soldier-computer interface designs that produce more reliable systems needing fewer soldiers for error detection and correction.

**1213: CONCEPTS FOR EXTENDING THE PERFORMANCE OF MILITARY  
SYSTEMS IN COMBAT**

---

**TECHNOLOGICAL OPPORTUNITY:**

Ongoing development of powerful yet accessible soldier-system performance models with data bases enables system effectiveness to be related to soldier resources. The work associated with development of TRADOC's Concept Based Requirements System (CBRS) and doctrine development processes addresses the linkage between soldier and mission performance. The opportunity exists to create concepts for extending the performance of military systems at the mission level through the optimum design of combat units.

**TECHNOLOGICAL OBJECTIVE:**

To develop and evaluate methods and strategies for designing combat units that extend with a minimum of cost the combat performance of manned military systems.

**TECHNOLOGICAL IMPACT:**

The Army's likely missions will originate from an increasingly divergent range of situations, to which a given combat force must be able to respond quickly. Operations such as Desert Shield illustrate the probable circumstance in the future where CONUS-based units, not tailored for specific missions, will be the source of combat power drawn upon. Optimized unit design procedures will maximize the combat readiness and capability obtainable with a minimum of soldiers and system resources.

**6.2 PRIORITY: 24 OF 25**

---

**1215: AIR DEFENSE ARTILLERY C3I AND TARGET IDENTIFICATION**

---

**TECHNOLOGICAL OPPORTUNITY:**

Recent advances in sensor and message processing technology have improved the quality of information which can be rapidly transmitted in a command, control, communication, and intelligence (C3I) net. Real potential exists to overload the Air Defense Artillery (ADA) crew with excess or irrelevant target data. The proposed research will harness these advances by integrating them with the soldier's ability to process and interpret them.

**TECHNOLOGICAL OBJECTIVE:**

To increase air defense combat effectiveness by improving performance for (1) automated force operations in ADA C3I and (2) Forward Area Air Defense (FAAD) C3I engagement performance, and identifying command and control decision-making requirements including verification of hostiles during engagement operations.

**TECHNOLOGICAL IMPACT:**

Results of this research will ensure full air defense artillery integration with the AirLand Battle Future doctrine by helping to develop a C3I which maximizes the synthesis of reliable, accurate information and minimizes casualties from friendly fire.

**1301: IMPROVED METHODS FOR BATTLE COMMAND TRAINING**

---

**TECHNOLOGICAL OPPORTUNITY:**

Experimental evidence and lessons learned from training exercises have increasingly focused attention on the decision analytic approach to staff problem solving prescribed by Army doctrine and upon the requirement for the commander and staff to visualize and anticipate events. Theoretical developments in problem solving and group decision making suggest that current practices may profit from revisions in procedure, particularly under conditions of time stress and uncertainty. Research must be conducted to determine which procedures should be changed and how best to train the revised procedures.

**TECHNOLOGICAL OBJECTIVE:**

To improve battle command staff efficiency and effectiveness by (1) developing an understanding of small group problem-solving processes and (2) identifying effective approaches for battle command training of individuals and small groups. To develop and test prototype methods improving command group readiness training especially within the Army's Battle Command Training Program (BCTP) and the Tactical Commanders Development Program (TCDP).

**TECHNOLOGICAL IMPACT:**

Advances in training technology coupled with reductions in training overhead costs will permit the Army to conduct more frequent and tailored training exercises for its command staff elements, thereby increasing Army readiness and combat effectiveness.

**1303: ENHANCED TECHNIQUES FOR COMMAND STAFF PERFORMANCE**

---

**TECHNOLOGICAL OPPORTUNITY:**

Advances in the study of human performance, cognition, and group interaction provide the opportunities to enhance command and control (C2) by bringing the soldier to the forefront of consideration in combat developments. Staffs are known to take short cuts leading to incompletely considered plans, with few contingency options, because of individual and group tendencies and situational factors. The Army must take full opportunity to discover the roles and relative influences of the soldier, which are the mainstay for relying on C2 for battlefield success.

**TECHNOLOGICAL OBJECTIVE:**

The research will identify the complex, mental abilities required of effective commanders and staffs. These cognitive requirements will be used to define procedures that are flexible to the demands of the tactical environment, yet sufficiently structured to promote efficient coordination. The new knowledge procedures and the technologies generated from this research will improve command and control operations and survivability on the AirLand Battlefield by transitioning user-designed and -tested concepts to doctrinal and materiel proponents.

**TECHNOLOGICAL IMPACT:**

Successful integration of improved staff procedures, C2 technology, soldier quality, and organizational structure will ensure that future tactical commanders are supported with an effective, efficient, and resilient system for planning and executing combat operations.

**1306: INTELLIGENCE AND ELECTRONIC WARFARE SOLDIER PERFORMANCE  
FOR BATTLEFIELDS OF THE FUTURE**

---

**TECHNOLOGICAL OPPORTUNITY:**

In the future, military intelligence (MI) soldiers will not be able to adequately support the command staff unless they are able to perform in a rapidly changing, technologically complex environment. The Army Intelligence and Electronic Warfare Modernization Plan has developed an acquisition strategy to ensure that MI can meet these demands. With the acquisition of updated IEW collection and processing systems, existing collection, processing, and analysis strategies must be modified and new strategies must be explored in order to take advantage of these new systems and make the systems responsive to soldier capabilities.

**TECHNOLOGICAL OBJECTIVE:**

Develop cognitive information processing and inferencing strategies which expedite the collection, extraction, and delivery of battlefield information, and enhance the analyses necessary for predictive intelligence.

**TECHNOLOGICAL IMPACT:**

Improved strategies to optimize the use of intelligence assets to enhance coverage of enemy activities and increase analytical proficiency will result in a powerful force multiplier.

---

**1308: METHODS FOR EVALUATING C2 PROCESSES AND PERFORMANCE**

---

**TECHNOLOGICAL OPPORTUNITY:**

The Army is attempting to standardize capstone training for division and corps Headquarters. Further, a mechanism has been established to archive data from such training exercises. A technology for providing improved diagnostic feedback and for capturing performance data has been developed by ARI, known as Army Command and Control Evaluation System (ACCES). The pending availability of such data makes it possible in theory to construct an analytical model of command and control which can be used to predict the impact on performance of proposed changes in command post staffing, equipment, and procedures.

**TECHNOLOGICAL OBJECTIVE:**

To develop and implement a prototype theoretical framework of a command and control performance data base and an analytic model of staff performance to support the development of lessons learned and the objective evaluation of Command and Control (C2) hardware and software systems, staff procedures, and organizations associated with the Army Tactical Command and Control System (ATCCS).

**TECHNOLOGICAL IMPACT:**

This development will provide the Army with refined concepts for an objective method for assessing C2 effectiveness in division and corps exercises and for assessing the benefit of proposed new doctrine and systems for C2.

**Exploratory Development**

**PROGRAM AREA 2: Manning and Leading the Force**

- 2108: OFFICER CAREER DEVELOPMENT TECHNOLOGIES**
- 2109: TECHNOLOGICAL APPLICATIONS TO IMPROVE RECRUITING**
- 2211: ALTERNATIVE SELECTION AND EVALUATION TECHNIQUES**
- 2218: DETERMINING MINIMAL ENTRY QUALIFICATIONS**
- 2304: LONG-TERM EFFECTS OF MILITARY SERVICE: OFFICER CAREER PATTERNS**
- 2306: SOCIO-PSYCHOLOGICAL BENEFITS OF ARMY SERVICE**
- 2405: FACTORS INFLUENCING LEADERSHIP EFFECTIVENESS**

---

**2108: OFFICER CAREER DEVELOPMENT TECHNOLOGIES**

---

**TECHNOLOGICAL OPPORTUNITY:**

The effects of recent Congressional and Army policy changes and requirements on officer career development have not been tracked. New technologies may provide opportunities to assess the simultaneous impact of multi-level organizational changes, historical events, and individual career events. Policy makers need information and tools to ensure that complex career development requirements are well managed. Such decision aids and information sources may help the Army meet its officer manpower and personnel requirements.

**TECHNOLOGICAL OBJECTIVE:**

To explore and establish research and development methodologies and tools to provide officer career related information to policy makers. Existing methods and prototypes from Army, civilian, and other military manpower and personnel technologies will be examined for their cost-effectiveness and empirical soundness for application to officer career development issues. New qualitative and quantitative data and methodologies will be explored to allow rapid responses to changing officer career policies and events.

**TECHNOLOGICAL IMPACT:**

Prototypes and methods will be developed that identify the costs and benefits of alternative officer force structure changes and plans through the career cycle. These methodologies may provide a more accurate means for organizing complex information needed for policy analysis, allowing long-term determination of officer career development policy effectiveness, especially regarding academic preparation, functional area specialization, and joint career assignments. This will provide information needed for more rapid intervention and policy adjustments.

FY97

---

**2109: TECHNOLOGICAL APPLICATIONS TO IMPROVE RECRUITING**

---

**TECHNOLOGICAL OPPORTUNITY:**

New tools and methodologies are available to directly assess trade-offs among economic, psychological and socio-demographic factors that influence enlistment decisions. Such tools are now being developed and used in the civilian sector for rapid accumulation, analysis, and delivery of decision information. New technologies are also emerging in the area of attitude and demographic data collection that should be useful in providing Army decision-makers at all levels with better methods to obtain and use information on markets and individual prospects.

**TECHNOLOGICAL OBJECTIVE:**

To determine cost effective and statistically sound methods for the collection, analysis, and delivery of primary recruiting decision- and policy-making data and information. Both qualitative and quantitative methodologies for attitude and demographic information synthesis will be examined as they apply to personnel and recruiting decision-making. Explore new recruiting information technologies to provide recruiters with better sources of market data by which to identify and reach market segments. Examine future recruiting roles and determine the most effective methods for implementing rapid change to information systems.

**TECHNOLOGICAL IMPACT:**

Effects of economic, psychological, and sociological factors, as well as of incentives and marketing programs under Army control can be more rapidly and accurately identified. Methodologies providing the basis for more cost-effective obtaining of recruiting market information will show where efficiencies can be gained so that force quality can be sustained with fewer resources. These methodologies may provide the basis for the development and implementation of recruiting management programs and provide policy makers with more rapid information on recruiting and marketing approaches.

**2211: ALTERNATIVE SELECTION AND EVALUATION TECHNIQUES**

---

**TECHNOLOGICAL OPPORTUNITY:**

Traditional aptitude testing has involved a heavy reliance on general cognitive ability. While these tests have had reasonably good success in predicting performance, recent theoretical developments suggest that substantial improvements are possible.

**TECHNOLOGICAL OBJECTIVE:**

Increase the Army's selection and classification capability (a) new measurements of general ability, (b) improved prediction of leadership and stress-related performance, and (c) reduction of measurement error in temperament and psychomotor/spatial tests.

**TECHNOLOGICAL IMPACT:**

Aptitude tests currently play a predominant role in the selection and classification of all enlisted personnel, and a lesser role in the selection of officers. Should the apparent potential in new approaches to measurement of general ability be realized, the result would be increased accuracy in selecting those soldiers and officers who are likely to perform effectively in the Army.

**6.2 PRIORITY:** 12 OF 25

---

**2218: DETERMINING MINIMAL ENTRY QUALIFICATIONS**

---

**TECHNOLOGICAL OPPORTUNITY:**

New methods for determining minimal entry qualifications are needed. Existing methods are limited in coverage of relevant individual characteristics and in their linkage to specific levels of performance.

**TECHNOLOGICAL OBJECTIVE:**

(A) Identify individual characteristics that can help predict performance of soldiers with average to below average cognitive ability. (B) Identify Army Military Occupational Specialties (MOS) that can be performed most effectively by soldiers with average to below average cognitive ability. (C) Determine best composite for predicting performance of the soldiers. (D) Determine how to set minimum entry standards on these composites for individual MOS.

**TECHNOLOGICAL IMPACT:**

With the continued decline of the numbers of military-eligible youth, the Military Services may have to accept larger numbers of applicants of average to below average cognitive skills. If improved performance of such soldiers can be obtained by better prediction prior to accessioning, millions of dollars can be saved annually in recruiting and training costs associated with attrition of low ability soldiers. Improved performance can also enhance combat readiness.

**2304: LONG-TERM EFFECTS OF MILITARY SERVICE: OFFICER CAREER PATTERNS**

---

**TECHNOLOGICAL OPPORTUNITY:**

New theory and methods to conceptualize, describe and model officer career development patterns and decisions are emerging. These methods have not, as yet, been widely applied to understanding the long-term effects of military service, but early applications have proved promising.

**TECHNOLOGICAL OBJECTIVE:**

To develop new technologies to improve active duty and reserve officer recruiting and retention by identifying the benefits for the individual of Army service. Examine effect of prior military experiences on soldier productivity in the Active and Reserve forces? Determine how decisions are made throughout the military officer career cycle and how decisions can be influenced.

**TECHNOLOGICAL IMPACT:**

Development of a theoretical basis for the formulation of recruiting and career strategies for high quality officers.

**2306: SOCIO-PSYCHOLOGICAL BENEFITS OF ARMY SERVICE**

---

**TECHNOLOGICAL OPPORTUNITY:**

Traditional analyses of the effect of military service has involved heavy reliance on the economic benefits or earnings of veterans. While these technologies have had a reasonably good success in evaluating a part of social benefits of military service, recent theoretical developments in social life course analyses suggest that substantial improvements can be made by integrating economic and non-economic benefits of military service. The economic technologies encompassing earnings can be extended to evaluate monetary values of fringe benefits.

**TECHNOLOGICAL OBJECTIVE:**

Increase the Army's ability to measure economic and non-economic benefits of Army service. Develop process models rather than stage models of adult development to articulate the linkages between organizational, social, and historical changes and individual life course transitions.

**TECHNOLOGICAL IMPACT:**

Economic technologies currently play a predominant role in the theoretical development of social welfare effects of military service. Should the apparent potential in new approaches to measurement of comprehensive benefits be realized, the result would considerably enhance the framework of the beneficial effects generated by military service. The Army would tend to benefit by the newer measurements in terms of increased recruitment and retention of high quality soldiers and their continuation in Army Reserve/National Guard units.

**2405: FACTORS INFLUENCING LEADERSHIP EFFECTIVENESS**

---

**TECHNOLOGICAL OPPORTUNITY:**

The experience of Desert Storm commanders, from the four-star down through battalion command levels provides a unique opportunity for filling voids in current mid-level leadership doctrine. Current doctrine reflects full understanding of mid-level leadership factors that affect organizational performance. Research is needed to develop the empirical base for theoretically-sound leadership doctrine. It must reflect sequential and progressive increase in leadership performance requirements at successively higher levels and provide tested principles and techniques for enhancing innovative thinking.

**TECHNOLOGICAL OBJECTIVE:**

To develop concepts and principles of instruction to enable the more effective mid-level and strategic leadership training. The research will develop and test training methods designed to give students insight into their problem solving strategies. Interview findings with Desert Storm commanders will be used to identify the processes and methods used at the mid-level to translate and communicate the commander's operational concepts to the fighting units. Emphasis will be on information flow, planning, command and control, personal management policies, procedures and operating practices.

**TECHNOLOGICAL IMPACT:**

This research will provide a descriptive theoretical basis for the design of leader development and training policy across the different service school and command levels.

**3103: TECHNOLOGIES FOR COLLECTIVE TRAINING DEVELOPMENT**

---

**TECHNOLOGICAL OPPORTUNITY:**

Significant progress in research in expert systems technology and cognitive/instructional psychology (e.g., cognitive models of the authoring process) have provided the opportunity for developing technologies in the form of computer-based tools for supporting the process of collective training development.

**TECHNOLOGICAL OBJECTIVE:**

To design and develop prototype automated tools and techniques that make collective training development more effective and efficient by providing new capabilities to users who do not have much training development experience.

**TECHNOLOGICAL IMPACT:**

Decision aids for mission/task analysis, training requirements specification, and development of unit training programs, will reduce the time and developmental costs of these efforts. Success in this program will significantly reduce the resources and expertise required to create and update collective training programs. For example, reduction in the time needed to produce ARTEP/AMTP documents will result in timely training products that more accurately present current tactical doctrine and training requirements, and thereby, help maintain force readiness.

**3106: THE USE OF SIMULATED ENVIRONMENTS FOR TRAINING**

---

**TECHNOLOGICAL OPPORTUNITY:**

Technological advances such as Computer Image Generators, vehicle electronics, virtual environments (e.g., "cyberspace") and helmet-mounted displays are rapidly increasing the Army's capability to simulate significant aspects of the combat environment for individual and unit training and for performance assessment. These new technologies cannot be used to maximum effectiveness, however, without the development of a corresponding "behavioral technology" for the development of strategies for their employment in an integrated soldier, leader, and unit training system.

**TECHNOLOGICAL OBJECTIVE:**

To develop and evaluate methods and strategies for the use of simulated training environments (such as virtual reality or "cyberspace") in stand-alone devices and networked simulators.

**TECHNOLOGICAL IMPACT:**

Improved specifications for utilization of stand-alone and networked devices to create realistically simulated combat training environments for leaders and individual soldiers that will reduce the cost of training exercises and mission rehearsal in terms of fuel, ammunition, facilities, environmental impact, security, and time.

**6.2 PRIORITY:** 16 OF 25

**3201: LOW-COMPLEXITY SIMULATION TRAINING FOR AVIATION UNIT  
TACTICAL SUPERIORITY**

---

**TECHNOLOGICAL OPPORTUNITY:**

Recent dramatic advances in computer graphics and microprocessor based technology will be exploited in a joint U.S. Army/Canadian/U.S. Air Force research facility that ARI is developing at Fort Rucker. This rotary wing simulator testbed will provide the opportunity for research to identify the minimum levels of simulator fidelity that are essential for effective aviation task training.

**TECHNOLOGICAL OBJECTIVE:**

To develop a modular, rotary wing simulator testbed for research to establish the required training characteristics and functions of aviation task training devices and simulators.

**TECHNOLOGICAL IMPACT:**

A unique research facility will be available to determine minimum essential training requirements for aviation training devices and simulators. Research findings will be used in developing training requirements for future flight simulators which can be afforded at the company level for Active and Reserve Component aviators.

**3204: TRAINING REQUIREMENTS FOR COMBINED ARMS SIMULATORS**

---

**TECHNOLOGICAL OPPORTUNITY:**

To manage training efficiently, new methodologies for measuring unit performance effectiveness down to individual weapon system, and then applying the knowledge gained to manage training efficiently, need to be developed to take advantage of the technological advances in simulator networks (e.g., Simulation Network (SIMNET)).

**TECHNOLOGICAL OBJECTIVE:**

To design and develop performance measurement and training management methodologies for use with networked simulators as a means for improving combined arms unit training effectiveness.

**TECHNOLOGICAL IMPACT:**

The prototype measurement and training management methodologies will be used to support improvements in networked simulators. Advanced development of effective methods and measurement techniques for training with networked simulators will support units to train as they will fight.

**3206: TECHNOLOGY FOR TRAINING AND ASSESSING PERFORMANCE OF  
SMALL-UNIT COMMANDERS IN NETWORKED SIMULATORS**

---

**TECHNOLOGICAL OPPORTUNITY:**

The Battlefield Distributed Simulation Developmental (BDS-D) will provide a state-of-the-art soldier-in-the-loop simulation for units at battalion and below. BDS-D provides an opportunity for the development of new training and performance assessment technologies during the conceptual phase of system development. BDS-D's reconfigurability provides simulation of command and control systems as well as future target location (battlefield sensor) systems. Its flexible instrumentation capabilities also support the development and assessment of performance measurement technologies, the specification of future training requirements and the development of new training methods.

**TECHNOLOGICAL OBJECTIVE:**

To design and develop simulation-based performance assessment technologies and methods for training future leaders at battalion level and below, concentrating on the information integration and distribution requirements associated with new battlefield sensor and command and control systems being inserted in ground combat vehicles and operating centers in support of AirLand Operations doctrine.

**TECHNOLOGICAL IMPACT:**

The success of future AirLand Operations doctrine relies on the skills of small unit commanders to capitalize on new battlefield sensor systems to acquire, locate and track both enemy and friendly units and new automated communications systems to integrate and distribute this information. Taking full advantage of new simulation technologies for performance assessment and training ensures that commanders will have the requisite skills to fight and win on the future battlefield.

"Electronic Sandbox": A prototype training and assessment technology for information distribution FY96

---

**3210: ADVANCED LANGUAGE LEARNING TECHNOLOGY**

---

**TECHNOLOGICAL OPPORTUNITY:**

Rapid increase in the speed and power of computers, combined with recent improvements in understanding how foreign languages are learned, provide unique opportunities for developing individualized language instruction by computer. Basic research has begun to show which second language teaching techniques and strategies are most instructionally effective and motivating. The first computer-based systems that incorporate such strategies are now starting to be built and must be capitalized on with research to develop new capabilities for improving language skill training.

**TECHNOLOGICAL OBJECTIVE:**

To develop a computer-based tutor incorporating recent developments in electronic technology and learning strategies and techniques for the purpose of improving acquisition and sustainment training of military linguistic skills.

**TECHNOLOGICAL IMPACT:**

After a new language learning technology is developed, an advanced development effort will apply it to MOS-specific foreign language instruction. It is expected that there will be a 25% improvement in the efficiency with which language proficiency is increased from Level 0 to 2 by reducing instructor time needed to teach and maintain foreign language skills for specific Military Occupational Specialties (MOS).

---

**3221: SIMULATION FIDELITY REQUIREMENTS FOR COST-EFFECTIVE  
AVIATION TRAINING**

---

**TECHNOLOGICAL OPPORTUNITY:**

A joint Canadian/US Army/USAF simulator testbed for aviation training research is under development at Fort Rucker. This facility, which contains a state-of-the-art computer image generator (CIG) and visual system, provides the opportunity for determining minimum levels of simulation fidelity that are absolutely essential for specific tasks to be trained effectively at minimum cost. Variables that can be considered include display resolution, field of view, motion, weapons effects, etc.,

**TECHNOLOGICAL OBJECTIVE:**

To establish, through a comprehensive and systematic experimental program, the required simulation fidelity characteristics and training functions of devices varying in complexity from part-task trainer through full mission simulator as a function of specific tasks to be trained and the skill levels to be achieved.

**TECHNOLOGICAL IMPACT:**

Research findings will be used in developing training requirements and strategies for future flight simulators. As a result, lower cost flight simulators will be procured, capable of training all critical mission tasks. Efficiencies derived from this research will lead to more effective use of all training resources including aircraft flight time.

**6.2 PRIORITY: TBD**

---

**3302: ACQUISITION AND RETENTION OF COGNITIVE SKILLS**

---

**TECHNOLOGICAL OPPORTUNITY:**

New theories and research findings have emerged on the learning and retention of procedural tasks and complex perceptual-motor tasks. Research on perception, mathematical models of human information processing, programming, and skill decay have created the opportunity to consolidate our understanding of how soldiers acquire complex cognitive skills and retain them over time, through a unified theory of skill acquisition and retention.

**TECHNOLOGICAL OBJECTIVE:**

To develop and validate a theory of complex skill acquisition and retention that integrates recent research on individual skill proficiency; to test the model on a broad range of Army tasks, to ultimately provide training managers with the capability to identify requirements for planning training strategies that enhance the effectiveness of individual instruction.

**TECHNOLOGICAL IMPACT:**

Army trainers will be able to allocate training resources based on predictions of how well any particular skill is retained, rather than distributing time to across-the-board retraining. There will be better use of training resources by:

- identifying skills that are more likely to be forgotten
- identifying individuals who are more likely to forget
- recommending training strategies for improved acquisition and retention of complex cognitive skills

**3305: PERCEPTUAL SKILL TRAINING FOR COMBAT**

---

**TECHNOLOGICAL OPPORTUNITY:**

The use of night vision goggles and other visual aiding devices (e.g., thermal sights) provide a technological advantage to the U.S. Army. In circumstances when these devices are not available, however, our soldiers should be prepared to perform well without them. Sufficient empirical data are not available as to the trainability of perceptual skills required for operating effectively on the battlefield under varying illumination conditions.

**TECHNOLOGICAL OBJECTIVE:**

To determine what battlefield terrain visual characteristics and cues are essential to successful performance of battlefield tasks; to determine how to train perception of these cues under conditions varying from unaided nighttime illumination to daylight.

**TECHNOLOGICAL IMPACT:**

Increased understanding of the relationships between visual battlefield characteristics and soldier visual/perceptual processes will enhance battlefield performance through development of future training programs.

**3401: COLLECTIVE SKILL DEVELOPMENT AND SUSTAINMENT**

---

**TECHNOLOGICAL OPPORTUNITY:**

Individual soldiers' skills have been the focus of a body of previous research on procedural skill retention. An important outcome of this work was a skill retention model that allows the trainer to estimate task proficiency levels and project the rate of proficiency loss over a 12-month period based on task characteristics demonstrated to be related to skill retention. An opportunity exists to expand this model to estimate proficiency and retention of collective tasks.

**TECHNOLOGICAL OBJECTIVE:**

To develop predictive models and algorithms that estimate training requirements for sustaining a given level of collective skill proficiency, as a function of: collective task characteristics; time between training; rates of skill decay; and personnel turnover in the unit (squad, platoon, and company).

**TECHNOLOGICAL IMPACT:**

Accurate predictions of training requirements will improve scheduling of collective task training. Scarce training time and resources (e.g., OPTEMPO) will be used more productively by not training tasks when training is not needed; readiness will be improved by properly scheduling tasks for training when collective skills are deficient.

---

**3409: LEADER TRAINING TECHNIQUES FOR THE YEAR 2000**

---

**TECHNOLOGICAL OPPORTUNITY:**

Current leadership theories suggest a number of key situational factors, such as the attitudes and skill level of subordinates and the command climate, which affect the effectiveness of leadership styles. These theories can be advanced and tested for their applicability to expected changes in future battlefield conditions such as: the use of increasingly sophisticated technology for planning, controlling, and conducting operations; more closely integrated joint and multi-national operations; and highly intense, fluid, and fast paced situations in which units are potentially isolated from other elements of the organization.

**TECHNOLOGICAL OBJECTIVE:**

To expand current leadership theories by identifying the leadership warfighting skills and capabilities needed on the future battlefield and to design strategies for systematically training and developing them in junior and mid-level leaders.

**TECHNOLOGICAL IMPACT:**

Once validated, the theory-based training strategies designed in this research will significantly improve the Army's ability to prepare leaders for the future and upgrade the leadership training of its officers and NCOs.

**3415: VISUALIZATION OF THE BATTLEFIELD**

---

**TECHNOLOGY OPPORTUNITY:**

Battle is characterized by rapid changes in the tactical situation and complex requirements for coordination and synchronization of many, diverse force elements. A major doctrinal requirement is the development of procedures which will assist the commander in "seeing the battlefield" and synchronization of all his combat assets. The Combat Training Center (CTC) database (communications, videotape, digital, written), and advanced graphical displays established at the ARI Presidio of Monterey Field Unit provide an opportunity for designing state-of-the-art training. Specifically, research will focus on expert system approaches for measuring, analyzing and projecting the outcome of alternative courses of action taken at critical points in battles resident in the CTC database, and thereby providing the commander with assistance to "visualize" the battlefield.

**TECHNOLOGY OBJECTIVE:**

To demonstrate an expert system for measuring and analyzing battles conducted at the tactical Combat Training Centers (NTC, JRTC, CMTC, ), in order to provide commanders with the capability to "visualize the battlefield."

**IMPACT/POTENTIAL PAYOFF:**

This research will result in new skills for unit commanders to "visualize" a rapidly changing, dispersed and lethal battlefield. This capability will ultimately lead to more effective battlefield performance and improvement in tactical doctrine.

**6.2 Priority: 5 OF 25**

---

**3430: METHODOLOGIES FOR ASSESSING SIMULATION-BASED BRIGADE  
TRAINING ALTERNATIVES**

---

**TECHNOLOGY OPPORTUNITY:**

The availability of computer-supported simulations and battle exercises for unit combat training provide the opportunity to improve training for brigade task performance. Army Field Manuals 25-100 and 101 and the Army's recent Combined Arms Training Strategy (CATS) initiative provide the structure and guidance for what brigade training is needed for an efficient force. In support of that initiative, R&D is needed on how best to train and prepare a brigade for its new role as a key maneuver element in a mid-intensity air/land battle conflict. To make cost effective decisions, methodologies are needed for assessing training alternatives in all exercise phases -- planning, preparation, and execution. This R&D specifically will focus on creating methodologies for assessing brigade battle rehearsal effectiveness and training as a function of alternative approaches, e.g., the Battlefield Distributed Simulation (formerly SIMNET), National Training Center), and other training capabilities such as Command Post Exercises and Live Fire Exercises.

**TECHNOLOGY OBJECTIVE:**

To create a measurement capability for comparing mixes of brigade training alternatives using data obtained from computer-supported battle rehearsals and simulations.

**IMPACT/POTENTIAL PAYOFF:**

Measurement methodologies for mixing and matching training alternatives will more precisely define cost effective approaches to improving brigade training.

---

**1203: SOLDIER ERRORS IN FIRE SUPPORT AND OTHER AUTOMATED WEAPON SYSTEMS**

---

**ARMY NEED:**

Data from training centers, the National Training Center, and the Joint Readiness Training Center show that effective utilization of Field Artillery (FA) is not the general condition. The Army needs research on FA integration performance, as well as improved information concerning the extent to which the "decision-burdens" of specific positions (e.g., Chief of Section) change as automated task aids enable or require decisions to be made at lower levels.

**APPLICATION/PRODUCT OBJECTIVE:**

To improve fire support effectiveness by providing the Army with products to improve processes and performance of persons responsible for the integration and application of fires; and to improve the performance of soldiers using automated weapon systems by applying analytic methods to identify the cause of, and to reduce or mitigate the effect of, errors in performing tasks with automated systems.

**ARMY IMPACT/PAYOFF:**

A better understanding of FA task integration will enable the Army to increase the quantity and effectiveness of fires in battle situations. Development of a methodology to analyze automated task difficulty will enable the Army to quantify the potential reduction in training requirements and personnel aptitude levels that can result if automated task difficulty is reduced. It is not unrealistic to have a goal of 10% improvement in FA effectiveness following a 10% reduction in automated task performance error rates.

---

**1204: PERFORMANCE-BASED MANPOWER, PERSONNEL, AND TRAINING  
ESTIMATION**

---

**ARMY NEED:**

The goal of the Army MANPRINT strategy is to influence the design of new weapon systems and to improve their battlefield effectiveness by systematically considering soldier performance. The earlier HARDMAN I and II predicted manpower requirements, but, did not link soldier resources to battlefield effectiveness, and were too slow (six months) and too expensive (\$250K). Hence, they were ineffective at influencing system design. With no permanent analysis staff dedicated to MANPRINT, the Army's need was for an MPT estimation tool for pre-Milestone I use operable by existing GS-7-9-11 and Captain-Major level analysts.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop a third-generation set of manpower, personnel, and training (MPT) estimation techniques for combat and materiel developers that, for the first time, can relate manpower, personnel, and training to battlefield effectiveness of new materiel systems prior to Milestone I. Techniques will be integrated with one another so that they will support tradeoff analyses of MPT variables with weapon characteristics, performance, and system costs.

**ARMY IMPACT/PAYOFF:**

The first major product of this research will be HARDMAN III which will provide approximately five times more relevant decision information in 3-4 analyst-weeks than HARDMAN I or II does in 75-100 analyst-weeks.

**1205: SOLDIER PERFORMANCE IN THE CONCEPT-BASED REQUIREMENTS  
SYSTEM (CBRS)**

---

**ARMY NEED:**

The Army, through the MANPRINT Program, seeks to improve the combat effectiveness of battlefield systems by optimizing the integration of soldier capabilities and weapons system technology. Most materiel acquisition decisions affecting this integration are made prior to Milestone I. Therefore, improved methods are needed for linking soldier performance to mission performance goals in the CBRS where the basis for requirements are established regarding materiel, doctrine, training, organization, and leadership contributions to combat capability.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop analytical techniques, procedures, and information to enable the systematic consideration of soldier performance and resources in the Army's CBRS and related processes. Objective methods and databases will be provided to ensure that the soldier's role and soldier performance issues are explicitly considered in the analyses from which weapon system requirements are derived.

**ARMY IMPACT/PAYOFF:**

This research makes continued modernization more affordable by addressing the issues among doctrine, expected soldier quality and training, and system performance requirements before significant materiel R&D resources are committed.

**PROPONENT(S)/SPONSOR(S):** TRADOC (DCSCD)

**1210: REDUCING AVIATOR AND MAINTAINER REQUIREMENTS IN NEXT  
GENERATION ARMY AVIATION SYSTEMS**

---

**ARMY NEED:**

Recent advanced technology helicopters have substantially increased aircrew and maintenance demands and workload as well as the training required to develop and maintain proficiency. If these trends continue in emerging systems, the amount and cost of required transition and sustainment training can become prohibitive. The potential of advanced technology for reducing attention saturation, workload, and training requirements has not been fully realized in systems. This is because the Army lacks (1) the capability to analyze attention, workload, and training requirements and (2) proven helicopter system human factors design concepts for minimizing attention demands, workload, skill levels, and training.

**APPLICATION/PRODUCT OBJECTIVES:**

Develop and demonstrate MANPRINT manpower, personnel, and training tools that improve tactical performance and reduce aviator and maintainer expense of new Army aircraft. Use MANPRINT development experience with Army aviation to guide other MANPRINT R&D.

**ARMY IMPACT/PAYOFF:**

These efforts will improve the early identification of design factors that increase pilot workload and instances in which workload exceeds operator and maintainer capacity and will provide guidelines on how to structure the human requirements for systems to keep within the human capacity envelope. Enhancement of the Target Audience Description will lead to improved system design by giving system design engineers more empirical information on the abilities and attributes required for system operation and maintenance.

---

**1214: INFORMATION SYSTEM TECHNOLOGY FOR IMPROVING CREW  
COORDINATION AND PERFORMANCE IN THE COCKPIT**

---

**ARMY NEED:**

Research reveals that aircrew coordination errors, rather than individual pilot errors, contribute to significantly decreased safety and mission effectiveness for Army helicopters. This is shown by the frequent implication of such errors in accidents associated with terrain flight tactics and night vision devices (NVD). Information system technology (IST), as used in commercial aviation, should be examined for its potential in dealing with this high-workload, time-stressed environment.

**APPLICATION/PRODUCT OBJECTIVE:**

The objectives of this project are (1) to identify opportunities for IST interventions in the complex-task helicopter cockpit; (2) to develop prototype applications of IST for assisting aircrews in cockpit resource management, information sharing, and decision making under time-stressed conditions; and (3) to demonstrate the utility of these applications in an advanced rotary wing flight simulator. Emphasis will be given to nap-of-the-earth (NOE) obstacle avoidance and navigation, and to operations using NVDs.

**ARMY IMPACT/PAYOFF:**

Nearly 80% of all aviation and ground accidents involve human error. Of these accidents, a significant portion represents crew coordination failure during time-stressed, tactical operations. In addition, crew error underlies a significant portion of accidents attributed to emerging technologies (e.g., NVDs). Research also suggests that coordination errors degrade tactical mission performance (e.g., threat evasion). This project will help identify (1) promising design concepts for improving aircrew performance in emerging systems and (2) proven strategies for controlling NOE-flight and NVD related accidents.

---

**1216: MISSION AND PERFORMANCE-BASED ORGANIZATIONAL DESIGN**

---

**ARMY NEED:**

An exploratory development program just concluding has identified useful methods for predicting and measuring mental workload in Army situations. In parallel, a PC-based method to guide unit design, Systematic Organization Design (SORD), was developed and is being fielded through TRADOC schools. While SORD improves unit design through improved adherence to procedures, units in the smaller future Army must ensure that each soldier is fully task-loaded but without overloads that would affect mission success.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop methods to design units that consider soldier and crew workload and other soldier performance factors. Methods will be PC-based for use in organization design and evaluation to support combat, materiel, and training developments.

**ARMY IMPACT/PAYOFF:**

The Army's need to successfully respond to projected increases in mission requirements with fewer resources can ill afford unnecessary developmental risks. Yet, in more technologically complex systems and more sophisticated force structures, soldier-oriented issues and concerns become increasingly critical risk factors in achieving the combat capabilities to deter and defeat the threat. Validated techniques and procedures for assessing and utilizing soldier-related factors will permit combat and materiel developers to identify and resolve critical unit design and soldier-system interface problems early in the force development and system acquisition processes.

**1217: FORWARD AREA AIR DEFENSE (FAAD) PERFORMANCE IN A CHEMICAL ENVIRONMENT**

---

**ARMY NEED:**

Soldiers must be able to operate in a chemically-contaminated environment. The chemical protective ensemble is bulky and increases heat stress. The effects of the ensemble are differential across tasks and are affected by many variables. Commanders need to know the effects of fighting in a chemical environment and how to counter those effects which could impair mission success.

**APPLICATION/PRODUCT OBJECTIVE:**

Field tests have shown Stinger gunner engagement performance to be impaired by MOPP 4 protective clothing. The objectives of this project are to (1) quantify the FAAD team performance decrement experienced during sustained operations on the integrated battlefield, (2) determine how that team performance decrement affects adherence to AirLand Battle-Future doctrine, (3) identify near-term methods, procedures, and materiel to increase team ability to sustain mission capability of FAAD systems, and (4) generalize to other battlefield operating systems.

**ARMY IMPACT/PAYOFF:**

The Physiological and Psychological Effects of the NBC Environment and Sustained Operations on Systems in Combat (P2NBC2) program researches the impact of NBC and extended operations on combat performance. The products of this task will be used by the P2NBC2 program to address the physiological and psychological effects of NBC and sustained operations on FAAD and other systems in combat.

**1219: IMPACT OF DOCTRINE DESIGN ON SOLDIER PERFORMANCE IN COMBAT**

---

**ARMY NEED:**

The Army has undertaken a number of soldier-related initiatives to improve combat effectiveness with constrained resources: (1) The MANPRINT program improves battlefield effectiveness by optimizing the integration of soldiers with weapon systems technology, and (2) Training centers (NTC, JRTC, and other combat training centers) provide soldiers in a unit context more comprehensive and realistic combat experience. Doctrine is the mechanism that ties soldier capabilities, materiel, and training into units that provide combat power. Methods are needed to maximize the impact of doctrine on combat power by ensuring that soldier capabilities and issues are systematically addressed in the doctrine development process.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop analytical techniques, procedures, and information to enable the systematic consideration of soldier capabilities and performance in the design and development of doctrine. This research task will, in part, apply the exploratory development products pertaining to force structure design parameters and soldier performance in the TRADOC Concept-Based Requirements System (CBRS).

**ARMY IMPACT/PAYOFF:**

The focus of this program is on improving the processes of the design of the doctrine that serves as the integrating factor in the production of combat power. This research will make soldier-related initiatives more effective and Army modernization more affordable and tractable. Doctrine development will be conducted in full consideration of identified soldier MPT and performance constraints and capabilities.

**1304: ENHANCING COMMAND STAFF PERFORMANCE IN COMBAT  
OPERATIONS**

---

**ARMY NEED:**

The Army is responding to a greater diversity of missions, more uncertain threats, and a wider array of potential battlefield environments with increased automation, decreased manpower, and decentralization of the Army's Command and Control (C2) systems. Rapid, complete, and accurate information and decision aiding systems are needed to provide a performance advantage for the anticipated dynamic political climates and tactical situations. Human performance capabilities and compatibilities with these systems must be precisely addressed and used by the combat developers.

**APPLICATION/PRODUCT OBJECTIVE:**

The objective of this application is to generate empirically validated soldier-centered requirements for emerging C2 system applications such as the Maneuver Control System (MCS), the Force Level Control System (FLCS), Functional Command Post (FCP), and embedded tactical decision aids. Requirements will be generated and evaluated based on soldier and staff performance levels. The objective is to ensure robust tactical planning and synchronized execution by using the capabilities of the C2 systems to increase the use of METT-T factors.

**ARMY IMPACT/PAYOFF:**

Successful integration of improved staff procedures, C2 technology, soldier quality, and organizational structure will ensure that future tactical commanders are supported with an effective, efficient, and resilient system for planning and executing combat operations.

**1307: EVALUATING COMMAND POST PERFORMANCE**

---

**ARMY NEED:**

Improving and maintaining the effectiveness of multi-echelon Army command and control systems depends upon the availability of objective, quantitative methods for assessing command staff performance and contributions to battle command operations. To date, the Army lacks objective measurement systems and standards by which to evaluate staff decision processes and information flow in the context of field exercises, training exercises, hardware development activities, and laboratory tests. The development and validation of a measurement system and associated performance database will assist the Army in (1) ensuring the readiness of its operational command staffs and (2) measuring, evaluating, and developing lessons learned on the combat contributions of specific components of the Army's multi-billion dollar Army Tactical Command and Control System (ATCCS). The research task supports the total Army goals of readiness, leadership, materiel, and training, plus the TRADOC goals of doctrine, training, and leader development.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop and implement a prototype of a command and control performance database and an analytic model of staff performance to support the development of lessons learned and the objective evaluation of C2 hardware systems, staff procedures, and organizations associated with the Army Tactical Command and Control System.

**ARMY IMPACT/PAYOFF:**

This development will provide the Army with an objective method for assessing C2 effectiveness in division and corps exercises and for assessing the benefit of proposed new doctrine and systems for C2.

**1309: PROGNOSTIC MODELS OF MILITARY INTELLIGENCE (MI) SOLDIER  
INFORMATION PROCESSING PERFORMANCE**

---

**ARMY NEED:**

Combating new threats by using new technologies to leverage human performance is placing new requirements on soldiers' information processing and data analysis abilities. The cognitively complex tasks are not well understood and the impact of proposed force modernization changes on soldiers' performance and manpower demands are unknown. Already new sophisticated systems proposed for IEW threaten to increase, rather than reduce, demands on the soldier. Even the complexity of handling information for target acquisition has serious implications regarding skill level and manpower requirements. With the expected reduction in training resources and the requirement to downsize personnel resources, the Army must determine how to best utilize soldier-machine information processing capabilities.

**APPLICATION/PRODUCT OBJECTIVE:**

Generate predictive models of soldiers' information processing performance and develop computer simulation techniques which can be used to make quantitative judgments on how to increase battlefield effectiveness through optimal use of soldier-machine information processing capabilities.

**ARMY IMPACT/PAYOFF:**

Quantitative criteria and standards can significantly increase battlefield effectiveness through improved use of materiel and human information processing resources, and can significantly decrease the cost incurred by implementing inappropriate force modernization changes.

**1401: SOLDIER-SYSTEM CONSIDERATIONS IN FORCE DEVELOPMENT TESTING**

---

**ARMY NEED:**

The Army is challenged with every new budget to justify the expenses needed to attract and retain quality soldiers. The conduct of tests solely to determine the relationship between soldier characteristics (e.g., mental category) and the tactical performance of a variety of materiel systems is prohibitively expensive. This research, however, minimizes this problem by exploiting the opportunity provided by operational tests to collect soldier-in-the-loop performance data on the new weapons or other systems while they are being tested.

**APPLICATION/PRODUCT OBJECTIVE:**

To obtain soldier performance data from soldier-in-the-loop materiel tests that can be related to soldier characteristics; to improve the operational test process; to identify MANPRINT problems of new materiel undergoing user testing; to recommend solutions to these identified problems in the MANPRINT domains of manpower, personnel, and training; and to refer problems in the MANPRINT domains of human engineering, safety, and health hazards to the appropriate agency for corrective action.

**ARMY IMPACT/PAYOFF:**

For some weapon systems, an increase in gunner aptitude mental category has been found to improve tactical performance 50 to 100%. Documenting such relations whenever possible builds the Army's case for spending for soldier quality. It also enables force designers to knowledgeably place the available mental category soldiers in those MOSS with the greatest battlefield benefit. The second impact of this research is in the operational testing process itself. With T&E costs taking 10% of the weapons acquisition budget, more effective, efficient testing saves money - money that can be spent on more systems.

- 2402: ARMY CIVILIAN SUPERVISORY SELECTION METHODS**
- 2403: SENIOR LEADER DEVELOPMENT**

---

**2104: ENHANCING RECRUITING PERFORMANCE**

---

**ARMY NEED:**

The Army needs to enhance recruiter productivity. Although accession missions are being reduced, resources are being cut even as the eligible population continues to decline through 1995 and will remain below 1985 levels through 2010. Although the recruiting mission will continue to decline during transitioning, the experienced recruiting force is being cut even more drastically. The percentage of contracted recruits who attrit from the Delayed Entry Program (DEP) before accession has continually increased.

**APPLICATION/PRODUCT OBJECTIVE:**

Enhance recruiter performance through improved methods of training, assignment, and selection. Develop and evaluate formal and on-the-job training programs for recruiters in sales oriented areas. Develop/test/validate recruiting incentives and marketing appeals both for short-term effects (recruiting now) and long-term effects (retention influences on future recruiting needs). Develop and test/validate program alternatives to reduce DEP attrition.

**ARMY IMPACT/PAYOFF:**

Force quality can be sustained with fewer resources while recruiting from an increasingly competitive market. Recruiter effectiveness can be enhanced by the development of new, less costly recruiting initiatives and by making improvements to existing recruiting programs.

**2207: SELECTION AND CLASSIFICATION TESTS FOR CRITICAL MOS**

---

**ARMY NEED:**

Success in various critical Military Occupational Specialties (MOS) requires specific traits beyond those measured by current Army personnel tests. Tank and anti-tank gunnery, for example, require eye-hand coordination and spatial abilities. ARI has developed and experimentally validated a battery of new tests that measure many of these personal attributes. At present, the Army does not have a program for evaluating the new tests in an operational setting.

**APPLICATION/PRODUCT OBJECTIVE:**

To evaluate the applicability of newly-developed perceptual, psychomotor and biographical/temperament tests for particular selection and classification purposes.

**ARMY IMPACT/PAYOFF:**

The designed performance capability of critical weapon systems is often not achieved because of skill deficiencies in the human maintainers and operators. Cost-effective personnel tests, when implemented, will significantly reduce the gap between designed and actual system performance.

**PROPONENT(S)/SPONSOR(S):** ODCSPER (DMPM)

---

**2208: BUILDING THE CAREER FORCE**

---

**ARMY NEED:**

As the overall size of the Army shrinks, it becomes even more important that those who enter and those who remain in the Army are those most qualified to perform the activities required. Current selection and classification procedures are limited. They predict some, but not all, aspects of training and first tour performance. They are not oriented toward building an effective corps of junior NCO.

**APPLICATION/PRODUCT OBJECTIVE:**

This project is the culmination of a multi-stage research effort to develop an improved personnel system which will (1) select the right people, (2) put these people in the jobs they are most suited for, and (3) retain and promote the right people.

**ARMY IMPACT/PAYOFF:**

This effort will substantially improve a selection and classification system which ARI recently estimated produces annual benefits to the Army of \$250 million in terms of improved performance. Benefits will also accrue from improved promotion and reenlistment decisions. Those soldiers who are chosen as junior NCO provide leadership and continuity critical to the Army's success on the battlefield. This effort will link those decisions to proven indicators of future success.

---

**2209: SPECIALIZED MOS CLASSIFICATION AND ARMY-WIDE SELECTION METHODS**

---

**ARMY NEED:**

The Army has a continuing human resource concern for its high leverage, critical Military Occupational Specialties (MOS). There is a strong desire for tailored selection and classification (S&C) tools to make the best matches between soldiers' abilities and job requirements. The solutions are increasingly technical and need to be achieved within the DA ODCSPER manpower, personnel and resources constraints while meeting the needs of the MOS Proponents.

**APPLICATION/PRODUCT OBJECTIVE:**

The objective of this research is twofold: First, to conduct research on methods for determining which MOS are likely to have special S&C needs and to perform research with the MOS to meet those needs; and, second, on a larger scale to perform research dealing with the Army's selection and classification system as a whole in order to identify the potential for more efficient S&C procedures.

**ARMY IMPACT/PAYOFF:**

Improved S&C procedures for MOS such that each individual's abilities will be optimally matched to the job requirements. This improved matching will result in the best use possible of the Army's human resources (minimum attrition and optimum job performance).

**2214: SPECIAL FORCES CAREER ENHANCEMENT**

---

**ARMY NEED:**

Special Operations Forces work in a complex environment of rapid response, multi-lingual, multi-ethnic forces in various terrains with high family stress. The Army needs research which delineates procedures for recruitment, screening and cross-cultural communication skill development of Special Forces soldiers, while raising retention probability.

**APPLICATION/PRODUCT OBJECTIVE:**

Develop a profile of high performing Special Operations Forces soldiers. Provide Army planners with information and methods for recruitment, selection, training and retention of high performing soldiers in Special Operations Forces units.

**ARMY IMPACT/PAYOFF:**

This research will provide U.S. Army military leadership with critical and crucial information to increase readiness, retention, morale and unit performance of Special Forces units.

---

**2302: FAMILY-BASED SOLDIER RETENTION AND READINESS**

---

**ARMY NEED:**

Approximately 16% of total Army Expenditures are for family/Quality of Life programs. In an age of scarce resources and reduced manpower, the Army needs even better information on which policies, programs, and practices serve family needs and historic Army interests such as retention of quality individuals and meeting readiness requirements. According to GEN Vuono (1990): "Only by caring for our soldiers and their families will we be able to meet our most essential imperative, that of attracting and retaining high quality men and women."

**APPLICATION/PRODUCT OBJECTIVE:**

To develop databases, models, program evaluation technologies and policy options that assist the Army to retain quality soldiers, improve soldier and unit readiness, and increase family adaptation to Army life.

**ARMY IMPACT/PAYOFF:**

(1) Improved methodology for increasing family adaptation to Army life, (2) enhanced retention planning capabilities for managing evolving force changes, (3) better focused design and evaluation of retention interventions for use by DA policy makers and retention NCOs to increase the retention of high-performing soldiers, and (4) improved measures of individual and unit readiness.

**2402: ARMY CIVILIAN SUPERVISORY SELECTION METHODS**

---

**ARMY NEED:**

Modernization of the Army's civilian personnel management system is essential in order to preserve Total Army effectiveness in the face of the downsizing that will occur over the next several years. Major needs include supervisor selection tools and procedures, civilian leader training, and data bases to aid in tracking decisions on policies and programs for managing the Army's civilian work force.

**APPLICATION/PRODUCT OBJECTIVE:**

Selection tools and procedures to aid the Army in identifying, selecting, training, and developing high-quality supervisors and managers for the civilian work force. This research will develop selection tools for first- and second-line supervisors, and will establish a longitudinal data base for tracking the impact of policies and programs within the civilian work force.

**ARMY IMPACT/PAYOFF:**

Supervisor selection tools will improve the leadership of the Army's civilian component. Improved supervisory leadership, together with systematic improvement of the Army's civilian personnel management system, will greatly enhance the ability of the Army to attract and retain quality personnel and to manage those personnel in order to achieve higher levels of productivity at the same or lower personnel cost.

**2403: SENIOR LEADER DEVELOPMENT**

---

**ARMY NEED:**

AirLand Battle doctrine envisions a spectrum of warfare presenting major leader development challenges, among them the earlier development of thinking skills needed to read the battlefield and make independent decisions. These challenges are compounded by the requirement to maintain a high state of combat readiness in the face of severely declining resources and a shrinking Army. The Army need is for improved leader development, based on systematic analysis of the cognitive skills of senior leaders, and technologies to facilitate earlier acquisition of these skills.

**APPLICATION/PRODUCT OBJECTIVE:**

A theory-based understanding of leader development at mid and senior levels. A research data base developed from senior officer interviews for Army War College instructional use. Special texts on mid-level and strategic leadership. Technology for early assessment and development (via microprocessor-based simulations) of thinking skills required at senior levels.

**ARMY IMPACT/PAYOFF:**

The War College instruction and simulation technology made possible by this research will speed the development of the leadership and decision skills of mid-career Army leaders, and enhance their ability to operate in a distributed decision environment across the spectrum of conflict.

---

**3104: ADVANCED TECHNOLOGY FOR THE DESIGN OF TRAINING DEVICES  
AND SIMULATORS**

---

**ARMY NEED:**

Many trainers and the designers of training devices and simulators feel that these devices must resemble equipment/weapons system and that simulations must replicate in detail the environment simulated. However, while such expensive features may add to realism, they may not contribute to training the skills required to perform critical tasks. Essential instructional features, on the other hand, may be excluded. Procedures for distinguishing among device characteristics that are essential or only seem to be essential and associated cost trade-offs have only begun to be established. Design principles and methods are needed to aid device engineers in developing cost-effective training devices.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop decision support systems (DSS) for identifying critical task training features and for trading off design features, costs, and estimating training effectiveness of training devices and simulators.

**ARMY IMPACT/PAYOFF:**

The development and use of decision-support systems will enable engineers to conduct cost-effectiveness analyses of alternative device designs. This includes: (a) estimating the cost of minimally sufficient device features for achieving given training objectives; and (b) estimating the training benefits to be achieved from additional investments in device features that promote learning. Expected results are decreased costs and increased effectiveness of Army training devices.

**REQUIREMENT/MEMORANDUM OF AGREEMENT:** Pending

---

**3205: EFFECTIVE TANK GUNNERY TRAINING STRATEGIES**

---

**ARMY NEED:**

Increasing costs of unit training in the field, e.g., ammunition and OPTEMPO, as well as environmental limitations and greatly expanded weapons systems capabilities require greater dependence on simulators and training devices to provide gunnery and maneuver training for train-as-you-will-fight readiness. Improved training strategies must be developed to integrate simulation and field training into the most cost-effective mix. However, empirical data are not presently available to provide the basis for designing optimal training programs. Information is needed to determine required training resources and how to optimally allocate them to individual and collective gunnery training programs.

**APPLICATION/PRODUCT OBJECTIVE:**

To design, develop, and empirically evaluate alternative tank gunnery training/testing methods and strategies.

**ARMY IMPACT/PAYOFF:**

This research will provide the means for designing training programs using an optimal mix of simulator and field practice to attain combat readiness. Additionally, it will provide the empirical data necessary for quantifying justifications for necessary training resources and result in significant savings.

---

**3207: STRATEGIES FOR TRAINING WITH COMBINED ARMS SIMULATORS**

---

**ARMY NEED:**

As traditional training resources dwindle, tactical training will increasingly be accomplished through combined arms simulation. Methods for conducting/managing training and measuring unit performance need to be implemented to make effective use of new collective training technologies within the framework of the Standard Army Training System (SATS) and Combined Arms Training Strategies (CATS), to be developed by TRADOC. Trainers and training managers need guidance on how to develop and implement adaptive collective training based on units' needs and the capabilities of available training resources. Performance measurement tools such as the prototype Unit Performance Assessment System (UPAS) need to be applied and tailored to provide a basis for developing such guidance and integrating it into SATS or follow-on training management systems.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop prototype training methods, performance measurement tools, and training strategies for integrating combined arms simulators into unit training, focusing on the Close Combat Tactical Trainer (CCTT).

**ARMY IMPACT/PAYOFF:**

This research will provide guidance to trainers and training managers for making most effective use of the CCTT and other simulations becoming available through the 1990s. Units will be able to maintain required levels of combined arms proficiency even though field training resources become further constrained.

---

**3303: TECHNOLOGIES FOR TRAINING OPERATORS AND MAINTAINERS OF  
ADVANCED COMMUNICATIONS SYSTEMS**

---

**ARMY NEED:**

The large amount of training potentially required to meet the needs of the operators and maintainers of the Army's high technology communications and electronics equipment points to the need for more efficient training methods and technologies. The Army's Long Range Training Plan (DCSOPS and TRADOC) indicates a requirement to "exploit the use of technology in all training activities and systems" and "increase reliance upon simulation, simulators, and training devices to develop proficiency."

**APPLICATION/PRODUCT OBJECTIVE:**

To evaluate the application of emerging technologies (intelligent tutoring and decision aiding systems) in the training of Mobile Subscriber Equipment system operation and troubleshooting skills.

**ARMY IMPACT/PAYOFF:**

As over 30,000 soldiers are trained each year at the Signal School, new training technologies can produce significant cost savings, as well as improvements in soldier combat effectiveness. The application of advanced training technologies can reduce course length by up to 30% without changing the quality of the output.

---

**3308: APPLICATION OF TECHNOLOGY TO MEET RESERVE COMPONENT  
TRAINING NEEDS**

---

**ARMY NEED:**

In the Reserve Component (RC), trainers/training managers must meet unique challenges stemming from the geographical dispersion of units and the scarcity of training resources (e.g., time, mission-oriented equipment, training devices/aids, and access to live-fire/maneuver areas). Consequently, there is need to develop (a) device-based, low operational tempo (OPTEMPO)/live-fire training strategies designed for ease of use at the unit level, and (b) cost-effective strategies for remotely delivering training to soldiers at distributed locations.

**APPLICATION/PRODUCT OBJECTIVE:**

To improve the effectiveness, efficiency, and accessibility of RC training through development/assessment of candidate device-based and distributed training strategies.

**ARMY IMPACT/PAYOFF:**

RC use of technology-based training strategies will improve performance, reduce costs, and increase training accessibility by allowing soldiers to train at home station (i.e., armory; reserve center).

**3310: APPLICATIONS OF ADVANCED TRAINING TECHNOLOGIES TO LOGISTICS**

---

**ARMY NEED:**

Reports by GAO and 25 years of extensively documented research by Army agencies including ARI have pointed to chronic problems in logistics, i.e. maintenance and supply. These studies have shown that skill deficiency is a major cause of the problems. The Army needs to find more effective ways to train its maintainers and suppliers. TRADOC has concluded that automation of training development and management is critical to their improvement, because qualified developers are in short supply and development methods are inefficient. Research to support automation is available and emerging. However, there is a continuous need to ensure emerging technologies achieve their potential by demonstrations in operational settings.

**APPLICATION/PRODUCT OBJECTIVE:**

To demonstrate how prototype training development/management techniques and tools can be applied to logistics, and generalized to other TRADOC operational settings by incorporating these prototypes into the Army's Automated Systems Approach to Training (ASAT).

**ARMY IMPACT/PAYOFF:**

Successful demonstrations will increase acceptance and use of training technology, and thereby increase the speed and improve the quality of development, production, and delivery of training with a smaller and less experienced work force.

---

**3402: UNIT PERFORMANCE MEASUREMENT AND FIELD FEEDBACK FROM  
COMBAT TRAINING CENTERS (CTC)**

---

**ARMY NEED:**

Feedback to units on their performance at the CTC to correct training deficiencies, and development of Army Lessons Learned in tactical doctrine requires comprehensive, objective and reliable measures of unit performance for: missions, tasks and the battlefield operating systems. The need for feedback from unit performance to TRADOC service schools and centers is asserted by TRADOC's Mission Area Analysis, and other key requirements documents. Army Training 1990 states that, "External evaluation must be strengthened to ensure that objective, specific field feedback is aggressively obtained, analyzed and used to substantiate decisions or cause change to training. Evaluation must drive the training and training development system."

**APPLICATION/PRODUCT OBJECTIVE:**

To develop methods for objectively and accurately measuring unit performance at the CTCs; to develop the methodology required to provide the system with feedback for improving Army training, doctrine, and combat readiness.

**ARMY IMPACT/PAYOFF:**

Increased level of combat readiness made possible by improvements in: tactical doctrine, training support, training program design, and training management procedures resulting from more objective and reliable measurement of unit performance and lessons learned.

Eff. Date: 02 May 88

---

**3403: IMPACT OF COMBAT TRAINING CENTERS (CTC)/HOME STATION ON  
ARMY READINESS**

---

**ARMY NEED:**

The need for improving Army training, training management, leadership practices, and unit cohesion to insure combat readiness continues to be emphasized at the highest levels within the Army. Increasing constraints on resources will exacerbate the difficulties in achieving improvement. There is a need to determine how home station conditions and practices contribute to unit combat readiness, as measured by performance at both home station and the CTC.

**APPLICATION/PRODUCT OBJECTIVE:**

To identify and measure practices/procedures at home station which contribute to or predict effective unit performance as measured at the National Training Center (NTC); to develop and evaluate innovations at home station which can improve unit training readiness.

**ARMY IMPACT/PAYOFF:**

Unit training under the demanding conditions present at the CTC results in improved combat readiness of units undergoing that training. The linkage of unit and home station factors to performance of the units at the CTC will result in improved information for resourcing, doctrine, training, and policy, and contribute to improving readiness Army-wide.

**3404: LIGHT (INFANTRY) FORCES TRAINING AND PERFORMANCE  
MEASUREMENT**

---

**ARMY NEED:**

Light (Infantry) Forces must train to support unconventional warfare scenarios, perform operations of limited duration in support of host nation forces, and fight as a pivotal part of combined arms operations in developed regions of the world. Training for all these diverse missions must be effective and efficient as training resources diminish. There is a need to identify the training practices/procedures that will maximize Light Forces combat readiness.

**APPLICATION/PRODUCT OBJECTIVE:**

To relate training practices/procedures of Light (Infantry) Force units to effective performance at the Joint Readiness Training Center (JRTC); to identify unit training problems demonstrated by performance at the JRTC and to develop and evaluate potential solutions.

**ARMY IMPACT/PAYOFF:**

This research will provide the Army with an accurate assessment of the impact of home station training practices on Light Forces mission performance. Applying the findings of this research will result in improved training and combat readiness of Light Forces to perform effectively in future conflicts.

**3406: DETERMINANTS OF SMALL UNIT PERFORMANCE**

---

**ARMY NEED:**

Army doctrine states that leadership, unit cohesion and soldier motivation are primary factors that contribute to unit combat power and effectiveness. Further, the recently completed Leader Development Study by TRADOC indicates that leadership can be improved through better specification, validation, and measurement of the leadership behaviors critical to soldier and unit effectiveness. In the future, Army units may need to fight as small, autonomous entities. This will require technically and tactically competent leaders who can understand and manage unit dynamics to foster cohesion, commitment, and motivation.

**APPLICATION/PRODUCT OBJECTIVE:**

To explain the relationships of home station leadership, cohesion, and motivation to unit performance at the Combat Training Centers (CTC); to develop interventions that improve the Army's capability to develop and maintain leadership, motivation, cohesion and communication in small combat units.

**ARMY IMPACT/PAYOFF:**

This research will increase the Army's capability to train its leaders and units to prepare for and win in combat through improved home station policies, programs and procedures.

**3410: TOTAL AVIATION TRAINING SYSTEM FOR IMPROVING COMBAT  
READINESS**

---

**ARMY NEED:**

Reduced training resources require the implementation of low cost, low complexity training devices that will ensure the combat readiness of Army aviators and associated personnel. The use of simulators will help to ensure such readiness. However, simulator resources are also at a premium and would be cost prohibitive for skill acquisition and retention when less complex and costly training devices and programs may be used. Research is needed to determine the effects of low complexity devices on the combat readiness of aviation personnel and the optimum utilization of such devices as part of cost-effective training strategies for all levels of the Army aviation community.

**APPLICATION/PRODUCT OBJECTIVE:**

To define how the capabilities of low complexity and low cost training devices can improve the combat readiness of aviators, aircrews and support personnel; to determine the most cost-effective mixes of devices, aircraft and simulators for future aviation training strategies.

**ARMY IMPACT/PAYOFF:**

Defining the effects of low cost, low complexity training devices on combat readiness will allow aviation units to maintain a high state of readiness without large expenditures of scarce resources. Determining how low complexity devices can supplement use of highly complex simulators and aircraft will form optimal aviation training strategies reducing training time and costs.

**3413: TRAINING STRATEGIES FOR THE BATTALION TASK FORCE**

---

**ARMY NEED:**

Key points of AirLand Battle-Future (ALBF) doctrine are: (a) contingency operations growing in importance, (b) always joint operations, often combined, (c) the brigade is responsible for integrating Combat, Combat Support, and Combat Service Support activities, (d) logistics centralized in the Forward Support Battalion, and (e) command and control agility and synchronization are increasingly important. The Combined Arms Training Strategy (CATS) is intended to provide the structure and guidance to train the total Army to operate effectively as a combined arms force. It will also serve as the driver for training resource procurement, development, and management. Training strategies need to be developed to permit meeting both the ALBF and CATS requirements. Research is needed to assist in the development of more efficient/effective combined arms training.

**APPLICATION/PRODUCT OBJECTIVE:**

To develop a methodology for unit training managers to use to design, resource, and schedule Battalion Task Force training programs, as mission requirements change.

**ARMY IMPACT/PAYOFF:**

Improved Battalion Task Force training program management will achieve and maintain combat readiness with minimum resources (e.g., OPTEMPO).

**(SORD-PT)**

**STO V-B-1**

**SOLDIER ASSIGNMENT.** Develop improved methods by FY93 for selecting and assigning quality soldiers to each job to increase combat effectiveness, reducing attrition by 15% and improving performance by 10%. Develop by FY94 improved selection procedures for Special Operations/Low Intensity Conflict (SO/LIC) forces, reducing attrition by 25%.

**POC:** Dr. Zita Simutis, ARI

**TSO:** R. Klemmer

**Funding:** 63007/A792

**Supporting Tasks**

- 2207:** Selection and Classification Tests for Critical MOS
- 2208:** Building the Career Force
- 2209:** Specialized MOS Classification and Army-Wide Selection Methods
- 2214:** Special Forces Career Enhancement

**STO V-B-2**

**RECRUITING AND RETENTION OF QUALITY SOLDIERS.** By FY92, determine family-oriented policies and programs that will help ensure retention of quality soldiers, significantly increasing the cost-effectiveness of these policies/programs. By FY94, demonstrate prototype model to quantify the beneficial effects of Army experience for the individual and society. By FY94, demonstrate a recruiting incentives management model to ensure quality accessions, reducing accession costs by 5%.

**POC:** Dr. Zita Simutis, ARI

**TSO:** R. Klemmer

**Funding:** 63007/A792

### Supporting Tasks

- 2104: Enhancing Recruiting Performance
- 2302: Family-Based Soldier Retention and Readiness

#### STO V-B-3

MANPRINT ASSESSMENT TECHNIQUES. Develop by FY92 methods for assessing the impact of soldier-oriented HMPT variables on system operability, maintainability, force design and force structure. Demonstrate by FY93 improved hardware-manpower (HARDMAN) III methods for comprehensive estimation of human factors, manpower, personnel and training (HMPT) requirements early in combat development and system design, providing five times as much information in 3-4 weeks rather than 75-100 weeks. By FY94, develop methods to empirically determine MOS restructuring options in terms of manpower, personnel, and training impacts.

POC: Dr. Robin Keesee, ARI                      TSO: R. Klemmer

Funding: 63007/A793

### Supporting Tasks

- 1203: Soldier Errors in Fire Support and Other Automated Weapon Systems
- 1204: Performance-Based Manpower, Personnel and Training Estimation

#### STO V-B-4

SOLDIER-SYSTEM PERFORMANCE ENHANCEMENT. By FY93, develop analytic tools to identify soldier skill, knowledge, and ability requirements for new intelligence and electronic warfare (IEW) system design and training, reducing soldier-induced errors by a third. By FY94, demonstrate, through man-in-the-loop and crew-in-the-loop simulations, decision aids and procedures for crew-served and C3I systems to "help shift the load from the head to the hardware".

POC: Dr. Robin Keesee, ARI                      TSO: R. Klemmer

Funding: 63007/A793

### Supporting Tasks

- 1304: Enhanced Command Staff Performance in Combat Operations
- 1307: Evaluating Command Post Performance
- 1309: Prognostic Models of Military Intelligence (MI) Soldier Information Processing Performance

**STO V-B-5**

**SIMULATION FIDELITY.** Demonstrate by FY92 models that will trade off realism and cost for design of effective simulators/training devices at the lowest possible cost. Through joint Canadian/U.S Army/USAF effort, determine by FY93 the least expensive fidelity requirements for the first of a family of future aviation simulators.

POC: Dr. Jack Hiller, ARI

TSO: R. Klemmer

Funding: 62785/A790 and 63007/A63007

**Supporting Tasks**

- 3104: Advanced Technology for the Design of Training Devices and Simulators
- 3201: Low Complexity Simulation Training for Aviation Unit Tactical Superiority (6.2)
- 3221: Simulation Fidelity Requirements for Cost-Effective Aviation Training

**STO V-B-6**

**ARTIFICIAL INTELLIGENCE (AI) FOR TRAINING.** By FY94, demonstrate portable AI-based language training techniques. By FY95, demonstrate an AI-based "automated authoring" system for training materials, decreasing training development support costs by at least a third.

POC: Dr. Jack Hiller

TSO: R. Klemmer

Funding: 62785/A791

**Supporting Task**

- 3210: Advanced Language Learning Technology (6.2)

**STO V-B-7**

**UNIT TRAINING STRATEGIES.** To improve unit training efficiency by 30%: By FY92, develop cost-effective tank gunnery training strategies (mix of "live fire", individual training devices and team simulators) By FY93, determine the relationship between effective unit performance at the Combat Training Centers (CTCs) and home station training. Design by FY95 unit training strategies for the most cost effective mix of home station training, networked simulators (such as SIMNET and AIRNET), and CTC training, reducing TDY and range costs by 50% and costs of using actual equipment

by a factor of 10. Demonstrate by FY97 an expert system for assessing unit tactical performance at CTCs, increasing the precision for measuring unit combat readiness.

POC: Dr. Jack Hiller, ARI

TSO: R. Klemmer

Funding: 63007/A794

#### Supporting Tasks

- 3205: Effective Tank Gunnery Training Strategies
- 3207: Strategies for Training with Combined Arms Simulators
- 3402: Unit Performance Measurement and Field Feedback From Combat Training Centers
- 3403: Impact Of Combat Training Centers (CTC)/Home Station on Army Readiness
- 3404: Light (Infantry) Forces Training and Performance Measurement
- 3415: Visualization of the Battlefield (6.2)

#### STO V-B-8

COGNITIVE AND COLLECTIVE SKILL RETENTION. To increase combat training effectiveness by at least 10 %: Demonstrate training strategies for cognitive (problem solving) skill acquisition and retention for various critical tasks by FY93. Demonstrate by FY93 training techniques/strategies to enhance Reserve Component (RC) unit readiness with limited training time. By FY94, demonstrate collective skill retention strategies for estimating needed retraining for combat unit tasks.

POC: Dr. Jack Hiller, and

TSO: R. Klemmer

Funding: 62785/A791 and 63007/A794

#### Supporting Tasks

- 3302: Acquisition and Retention of Cognitive Skills (6.2)
- 3308: Application of Technology to Meet Reserve Component Training Needs
- 3401: Collective Skill Development and Sustainment (6.2)

#### STO V-B-9

LEADERSHIP AND COMMAND STAFF TRAINING. By FY92, empirically determine the relationship of leadership, cohesion and motivation to unit tactical performance. Develop training strategies by FY92 for improving senior (GO level) decision

making/war fighting skills. By FY95, demonstrate prototype method to improve command group readiness training that requires 40-60% fewer support personnel.

POC: Dr. Jack Hiller

TSO: R. Klemmer

Funding: 62785/791 and 63007/A792 and A794

#### Supporting Tasks

- 1303: Enhanced Techniques for Command Staff  
Performance (5.2)
- 2403: Senior Leader Development
- 3406: Determinants of Small Unit Performance
